MultiChecker Ver.2 Series

**It won't stop advancing. The monstrously small A Series!**

Image Processing Device  
MICRO-IMAGECHECKER A210·A110 MultiChecker V2 Series  
ARCT1B178E-3 '04.3

Smart Solutions by **NAIS**

# The MultiChecker V2 Series - more powerful than ever!

Our highly acclaimed, compact A210 and A110 MultiChecker image processing units are now even more powerful! The V2 (Ver. 2) upgrade includes new functions for even greater convenience. To meet your diverse range of inspection requirements, we have increased the number of checkers by a factor of three. In addition to making more inspection locations possible, they now come equipped with a new mode that allows two-level branch inspection using one image checker, and an extensive range of functions that allow use in a wide range of applications.

*Three times the processing capacity of their predecessors!  
Designed to meet a diverse variety of inspection needs!*

You can now register **three times** more checkers per type!

A210 MultiChecker: increased from 32 to **96**

A110 MultiChecker: increased from 16 to **48**

Possible to choose from **three execution modes** to suit your inspection requirements!

MICRO-IMAGECHECKER A210 and A110 MultiChecker V2 (Photo shows A210)

## Automatic Switch Mode

Branch inspection without complicated settings provides great convenience!

### Example

It is possible to first make a direction judgment, and then perform a separate inspection (character appearance or mark width measurement) based on this direction.

### Conventional method

Execute all checkers and output results  
Perform direction judgment externally and compare results  
**Execution time: 65msec.**

### Automatic Switch Mode

Perform direction judgment and execute the required checker  
**Execution time: 35msec!** *Execution time reduced by half!*

## User-Defined Mode

**Multiple inspections of up to three blocks with no switching time!**

### Example

When you wish to perform multiple continuous inspections because the work will not fit in the field of view of a single image capture.

### Conventional method

Handled by type switching using an external device. Type switching requires time and usage restrictions apply.

### User-Defined Mode

Internally switches to the process block via an external signal. External device is not used, so inspection time is greatly reduced!  
\*Can be executed from the keypad as well.

## Execute All Mode

**Three times the number of checkers can now be registered per type, so you can inspect many points at one time!**

### Example

Multiple simultaneous point inspection possible for applications such as inspecting LED lighting.

Plenty of external outputs for judgment results (96 points for the A210 and 48 points for the A110) allow simultaneous output of judgment results for multiple inspection points.

# As always, the A Series is packed with easy-to-use features.

In addition to the ease-of-use and reliability that you expect from the No. 1 manufacturer in the field, we also provide convenient new functions for a diverse range of solutions.

## Convenient new display function

### Data Monitor Function

Titles and results of numerical calculations and judgment outputs can be displayed on the inspection screen. You can register your own text for display, and change the maximum and minimum limits for numerical calculations directly from the menu.

### Marker Function

Up to eight graphics (circles, ellipses, rectangles and lines) can be displayed on the inspection screen. This is very convenient when performing manual positioning for camera adjustment with production equipment.

### Two-image switch/split function (A210 only)

When using two cameras simultaneously for an operation such as measuring the distance between two points, you can use an external signal to switch the display. It is also possible to split images captured by two cameras for display as one image on the screen. You can select either vertical or horizontal for the image split direction.

## Extensive array of image capture functions

### Double-speed random camera (progressive rectangular-lattice CCD element)

With the A series, we introduced a progressive double-speed random camera that provides 3 times the maximum ratio of conventional units with 1/60 second for a high-quality picture and no image degradation. In field mode, it reaches 4 times for 1/120 second. The result is fast inspection without having to worry about inspection time or image quality.

### Internal synchronous signal inspection

Compatible with the internal synchronous signal of NTSC, video scopes and special cameras can also be used. However, depending on the model, some may not be able to be connected. Consult your Matsushita Electric Works representative (there is one connection port).

### (Fastest images in its class)

\*The shutter speed on the random camera, before exposure, needs to be set to 1/120 to 1/20000 seconds.

## Connects to a variety of PLCs

The A Series can connect to a range of PLCs without a communication program. In addition to the Matsushita Electric Works PLC-FP Series, it can be used with PLC products from Mitsubishi, Omron, and Allen-Bradley (Ver. 2.2 or later).

The A Series can perform type switching data communication and read and write measurement data and inspection results to and from PLCs without requiring that you create a communication program.

### Compatible PLC products

- Matsushita Electric Works FP Series
- Mitsubishi MELSEC A series/FX Series
- Omron SYSMAC-C Series
- Allen-Bradley SLC500 (Ver. 2.2 or later)

**Inspection conditions can also be modified from the PLC!**

## Speed and precision (Strongest in its class)

The A series comes equipped with a 32-bit RISC, 200 MHz CPU with pipeline processing.

It attains 360 MIPS and 1.4 GFLOPS for astronomically high-speed processing. With the super-quick CPU, increased floating point operation speed, pipeline processing, specially designed algorithms, and a large memory capacity, it achieves not only extremely high-speed inspection, but also the ultimate in precision as well.

## Reduced size (Smallest in its class)

With a small 120 x 40mm footprint, installation is simple. Tight installation with checkers next to each other is also possible. With considerations for wiring, connectors, and removable terminal blocks, installation with all units facing one direction is possible for no wasted space. Installation on DIN rails is also possible.

## Two types available to suit your application

**A210 with two camera connections and high-end functions**

A210 (set)

**A110 with one camera connection and good cost performance**

We offer true cost performance and wipe away the concept that image processing is expensive.

A110 Controller

A110 (set)

# Further refined inspection functions.

The A Series is loaded with inspection know how that we have distilled over our years in this industry.

With a single unit you can perform fast and accurate detection, dimension measurement and coordinate detection!

## 1 Smart matching (A210) / Matching (A110).

### A High-speed, high-precision sub-pixel detection (Fastest level in its class).

With a high-speed CPU, vast memory, and original algorithm, even with a 64 64-pixel template, 256 256-pixel search area, and sub-pixel precision detection, you still get a processing time of **about 10 ms**. As you can see, this is the ultimate in speed and precision for position detection.

### B Smart matching (A210).

Sub-pixel position detection takes place with gray-scale matching and the gray-scale differential function gives even more detailed work inspection.

This gives you accurate inspection even in cases where matching processing alone would fail.

### C Smart template (A210).

Just by showing multiple examples of the correct products, correct product images can be automatically composed. This allows simple inspection without setting complex parameters.

## 2 Sub-pixel gray-scale edge

Edge positions are measured accurately at the sub-pixel level. Also supports an edge counting function. Also equipped with the projection scanning formula so that the required edge position is detected even with products with a poor surface. With rotational adjustment, diagonal scanning performs sub-pixel edge detection with the gray-scale inter-pixel compensating function.

### D Smart matching rotational adjustment (A210)

With the rotational adjustment function and the A210, a search is conducted by tilting the matching and smart matching search areas and templates. Therefore, even if the work has been tilted, a more precise position inspection is obtained.

### E Rotation position/tilt detection.

With the rotation search function ( $\pm 30$  degrees), no matter how much the detection image is tilted, the position and angle of tilt are accurately ascertained.

### F Multiple position detection

Supports the multiple detection function with matching to allow the separate detection of multiple objects of the same pattern in the search area. It is an efficient function when loading is performed by robot or the like.

### G Teaching function.

Teaching allows changes to be made to the template for matching even from an external signal. Registering the change can be done simply by showing the object for detection.

Teaching also supports positional corrections so that even when work is displaced, teaching can occur.

## 3 Gray-scale window

Since the average value for brightness within the area is quickly calculated, directional distinction can still occur even when binary distinction is difficult due to the small differences in the gray-scale levels. You can set mask processing with free shapes (rectangular, oval, polygonal) set to match the inspected object.

## 4 Rotational\* position adjustment function

Automatic adjustment and precise inspection takes place even if the work is tilted or displaced.

Adjustments can be made using the gray-scale data so that differences in brightness can allow accurate corrections. With multiple and priority functions, complex adjustments are also greatly simplified.

\*A210 = rotational position adjustment function (X/Y/ )  
A110 = position adjustment function (X/Y)

### Rotational adjustment (A210)

### Accurate position adjustment (A210/A110)

## 5 Improved binary processing function

### A A wide range of inspection functions

- Position/size/attitude/size detection with optimum feature extraction labeling.
- Presence/size/orientation inspection with optimum binary window functions.
- High-speed dimension measurements with optimum binary edge detection functions.
- High-speed length/number/presence inspections with optimum line functions.

### B Free shape

The shape of the inspection area can be freely adjusted between rectangular, oval, or polygonal to match the inspection object. Moreover the mask area (where no inspection takes place) can also be adjusted freely as desired.

### C Image filter function.

Even with binary images containing substantial noise, stable image processing is possible using filter processing such as [image erosion] [image dilation]. The filter functions will differ depending on the inspection processing.

## 6 More numerical calculation and judgement output functions.

### A Supports 96 numerical calculation formulas (48 for the A110)

Includes sine, cos, square root, arctan absolute differential and projection distance functions in addition to addition, subtraction, multiplication and division, and you can set up to 96 formulas (48 for the A110). You can also reference up to 16 items per formula for complex calculations.

Calculating distances and angles

### B Leeway in judgement calculations

Even for complex pass/fail judgement outputs, internal judgement formulae can be made without using the external PLC. Depending on the application, Judgement output can be set for individual and general judgement for each inspection area freely as desired.

Judgement output formula

	Internal judgement calculations	External judgement calculations	Total
A210	96 formulae	96 formulae	192 formulae
A110	48 formulae	48 formulae	96 formulae

**New calculation formula copy function**  
(also compatible with judgment formulas)

### C Programless data transfer to the PLC

Using the Matsushita Electric Works. FP-series PLC, the Mitsubishi MELSEC A/FX series PLC, the Omron SYSMAC C series PLC, or the Allen-Bradley SLC 500 PLC (Ver. 2.2 or later), numerical calculation result data and judgement output results can be automatically written to the data register of the PLC at a maximum baud rate of 115200 bps. The image processing data can be used with the I/O sensitivity of the PLC.

# Excellent maintenance characteristics and global compatibility.

Powerful support for startup and maintenance and designed for worldwide use.

## Image storage function (A210, A110)

The A Series can store up to 30 defect images, and with the dedicated software tools you analyze the cause of defects at remote locations using e-mail.

Storing up to 30 pictures\* of fault occurrences in its memory, it is possible for analyzing error causes and making adjustments. When setting up the equipment, inspection images are stored and can be used when making new adjustments and changes. Moreover, the stored images can be used for testing. Also, using special software, image data and inspection conditions can be stored, and then faults can be analyzed and adjustments made at any location using e-mail. Furthermore, the location of all errors are clearly displayed and illuminated so that they can be seen at a glance.

\*A210 = 30 image, A110 = 8 images

**Vision Backup-Tool Ver.2**

The product data created with the MICRO-IMAGECHECKER A series and the image data stored in the controller can be stored on a PC using Windows. Stored data can be restored to the A series controller.

\* However, it is not possible to directly restore type data backed up using Vision Backup-Tool with the previous product (Ver. 1) to V2 (Ver. 2). In this case, use the dedicated data conversion software (freeware) to convert the Ver. 1 type data for V2 use, then transfer it to V2 and perform a backup again. If you require the data conversion software, contact your Matsushita Automation Controls Co. Ltd. representative.

## Setup help function

Quantitative support for settings that once relied on intuition.

With the setup help function, focusing, brightness adjustment, exposure adjustment, binary level settings, and other adjustments that used to be performed by the operator's professional experience, these adjustments can now be performed quantitatively. Equipped with an input monitor and test output functions, connections to external equipment are also greatly simplified. Great savings can be made in debugging and adjustment by the combination of the trap function, which halts inspection when an error is found, and the image storage and spreadsheet functions.

## Global application

English-Japanese interchange and CE certification

Displays for the one controller can be set to either English or Japanese to allow use in a great number of countries around the globe. The controller and high-speed random trigger camera are standard products and are certified with CE markings.

\* Type data saved in the previous controller of the MICRO-IMAGECHECKER A Series (Ver. 1) cannot be directly restored to V2 using the Vision Backup-Tool. In this case, you will need the dedicated data conversion software (freeware) to convert the Ver. 1 type data for V2 use. If you require the data conversion software or information about how to use it, please contact your dealer.

# MICRO-IMAGECHECKER® A210-A110 MultiChecker V2 Series

## System configuration diagram

### Vision Backup-Tool Ver.2

The product data created with the MICRO-IMAGECHECKER A series and the image data stored in the controller can be stored on a PC using Windows. Stored data can be restored to the A series controller.

\* However, it is not possible to directly restore type data backed up using Vision Backup-Tool with the previous product (Ver. 1) to V2 (Ver. 2). In this case, use the dedicated data conversion software (freeware) to convert the Ver. 1 type data for V2 use, then transfer it to V2 and perform a backup again. If you require the data conversion software, contact your Matsushita Automation Controls Co. Ltd. representative.

\*1 The A100 series connects to one camera.

\*2 Use where necessary.

\*3 When using 2 cameras with the A200 series, connect the same type of camera.
